I had a hard time starting the project, because I didn't know how to import the Maya Uvs into a substance painter. I had already used Substance painter previously, and I really liked it and messed with it before. First I added a material to my object in maya. I then exported the UVs into an FBX file. This is when I figured out you can import it to Substance painter simply by opening a new project in Substance painter and selecting the FBX file. After I imported the UVs, I baked the meshes and deleted the paint layer that auto generated.

My asset library where all the materials are was in the wrong place so I had to move it where I wanted it.

I placed the materials I thought were most important, like leather and metal, but I also added a black mask.

My biggest concern was the color of the material I assigned to the object. I had help at first, but I think I forgot most of it. For example the leather on my knife is brown automatically, but I wanted a black or grey leather instead. The same was for the blade of the knife, I wanted it to be a grey like color, but the material I used was not the right color. I changed the color by clicking the layer I wanted to change the color for. After that I clicked the properties tool where I was able to find the base color which I could then change, but for the leather I had to change 3 colors. I had to be careful not to click the mask in the layer I wanted, in fact I had to click the literal material in the layer. I also added dirt onto my blade by using a preset asset which had the dirt mask, which auto filled crevices with dirt.

I also added scratches by using a material with a black mask and adding a paint layer. Most of the layers I added a black mask onto the layer if they didn't already have one, which helped me add everything manually and more detailed.

I couldn't change the colors after a while though, because everytime I went into the properties tool it only showed the material assigned. I could mess with the roughness, but if I removed the material in the property tab, it removed it completely.

I will definitely need to mess with Substance painter a little more.
