For my substance design material, I wanted to go for a malachite and crystal stone rock vibe. I followed a tutorial that used lots of blend nodes and warp nodes. To create the rocky effect the tile node was used 3 times, just to make it feel more natural. My biggest concern was the surface of my object still feels too flat, I manually added a height node to try to make it more noticeable, but something still feels missing. Also I totally got confused about how to export the material to use in Maya, but I;m hoping I can figure it out. I also tried to use an Emission node, I'm not sure if maya can detect that though.
